Abstract

Sub
A1

A method and system for providing a user interface for a user to discover and control devices that are currently connected to a network, such that at least one of said devices performs steps including: (a) obtaining information from one or more of the devices currently connected to the network, said information including device

5   information; and (b) generating a user interface description based at least on the obtained information, the user interface description including a reference associated with the device information of each of said devices currently connected to the network, such that the reference includes at least one link to information contained in said devices currently connected to the network. As such, a user interface can be displayed

10 using the references in the user interface description, for controlling said devices currently connected to the network.
